3 Multivariate Normal Distribution (Marginal Distribution)

4 Singular Normal Distributions

イロト イポト イヨト イヨト

Some properties of normally distributed variables:

- The marginal distributions derived from multivariate normal distributions are also normal distributions.
- The conditional distributions derived from multivariate normal distributions are also normal distributions.
- The linear combinations of multivariate normal variates are normally distributed.

伺下 イヨト イヨト

Multivariate Normal Distribution (Linear Combination)

Theorem 1

Let $\mathbf{x} \sim \mathcal{N}_{\rho}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$, with $\boldsymbol{\Sigma} \succ \mathbf{0}$. Then

 $\mathbf{y} = \mathbf{C}\mathbf{x}$

is distributed according to $\mathcal{N}_{\rho}(\mathbf{C}\boldsymbol{\mu}, \mathbf{C}\boldsymbol{\Sigma}\mathbf{C}^{\top})$ for non-singular $\mathbf{C} \in \mathbb{R}^{\rho \times \rho}$.

Sketch of the proof:

- Let $f(\mathbf{x})$ be the density function of \mathbf{x} .
- 2 Let $g(\mathbf{y})$ be the density function of \mathbf{y} .
- **③** The relation $\mathbf{x} = \mathbf{C}^{-1}\mathbf{y}$ implies

$$g(\mathbf{y}) = f(\mathbf{u}^{-1}(\mathbf{y})) |\det(\mathbf{J}^{-1}(\mathbf{y}))|$$

with $\mathbf{u}(\mathbf{x}) = \mathbf{C}\mathbf{x}$, $\mathbf{u}^{-1}(\mathbf{y}) = \mathbf{C}^{-1}\mathbf{y}$ and $\mathbf{J}^{-1}(\mathbf{y}) = \mathbf{C}^{-1}$.

2 Multivariate Normal Distribution (Independence)

3 Multivariate Normal Distribution (Marginal Distribution)

< □ > < 同 > < 回 > < 回 > < 回 >

Multivariate Normal Distribution (Independence)

Theorem 2

If $\mathbf{x} = [x_1, \dots, x_p]^\top \sim \mathcal{N}_p(\boldsymbol{\mu}, \boldsymbol{\Sigma})$ with $\boldsymbol{\Sigma} \succ \mathbf{0}$. Let

 $\mathbf{x}^{(1)} = [x_1, \dots, x_q]^{ op}$ and $\mathbf{x}^{(2)} = [x_{q+1}, \dots, x_p]^{ op}$

for q < p. A necessary and sufficient condition for $\mathbf{x}^{(1)}$ and $\mathbf{x}^{(2)}$ to be independent is that each covariance of a variable from $\mathbf{x}^{(1)}$ and a variable from $\mathbf{x}^{(2)}$ is 0.

- The random vectors x⁽¹⁾ and x⁽²⁾ in can be replaced by any subset of x and the subset consisting of the remaining variables respectively.
- Interpretation of the provide the assumption of normality.

Multivariate Normal Distribution (Marginal Distribution)

< □ > < 同 > < 回 > < 回 > < 回 >

Multivariate Normal Distribution (Marginal Distribution)

Corollary 2.1

We use the notation in the proof as follows

$$\mathbf{x} = \begin{bmatrix} \mathbf{x}^{(1)} \\ \mathbf{x}^{(2)} \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} \boldsymbol{\mu}^{(1)} \\ \boldsymbol{\mu}^{(2)} \end{bmatrix}, \begin{bmatrix} \boldsymbol{\Sigma}_{11} & \boldsymbol{\Sigma}_{12} \\ \boldsymbol{\Sigma}_{21} & \boldsymbol{\Sigma}_{22} \end{bmatrix}
ight)$$

It shows that if $\mathbf{x}^{(1)}$ is uncorrelated with $\mathbf{x}^{(2)}$, the marginal distribution of $\mathbf{x}^{(1)}$ is $\mathcal{N}(\boldsymbol{\mu}^{(1)}, \boldsymbol{\Sigma}_{11})$ and the marginal distribution of $\mathbf{x}^{(2)}$ is $\mathcal{N}(\boldsymbol{\mu}^{(2)}, \boldsymbol{\Sigma}_{22})$.

In fact, this result holds even if the two sets are NOT uncorrelated.

< 同 ト < 三 ト < 三 ト

Multivariate Normal Distribution (Marginal Distribution)

We make a non-singular linear transformation $\mathbf{B} = -\boldsymbol{\Sigma}_{12}\boldsymbol{\Sigma}_{22}^{-1}$ to subvectors

$$\mathbf{y}^{(1)} = \mathbf{x}^{(1)} + \mathbf{B}\mathbf{x}^{(2)}$$
 and $\mathbf{y}^{(2)} = \mathbf{x}^{(2)}$

leading to the components of $\mathbf{y}^{(1)}$ are uncorrelated with the ones of $\mathbf{y}^{(2)}$. The vector

$$\mathbf{y} = \begin{bmatrix} \mathbf{y}^{(1)} \\ \mathbf{y}^{(2)} \end{bmatrix} = \begin{bmatrix} \mathbf{I} & -\boldsymbol{\Sigma}_{12}\boldsymbol{\Sigma}_{22}^{-1} \\ \mathbf{0} & \mathbf{I} \end{bmatrix} \begin{bmatrix} \mathbf{x}^{(1)} \\ \mathbf{x}^{(2)} \end{bmatrix} = \begin{bmatrix} \mathbf{I} & -\boldsymbol{\Sigma}_{12}\boldsymbol{\Sigma}_{22}^{-1} \\ \mathbf{0} & \mathbf{I} \end{bmatrix} \mathbf{x}$$

is a non-singular transform of $\boldsymbol{x},$ and therefore it is normally distributed

$$\mathbf{y} \sim \mathcal{N}\left(\begin{bmatrix} \boldsymbol{\mu}^{(1)} - \boldsymbol{\Sigma}_{12}\boldsymbol{\Sigma}_{22}^{-1}\boldsymbol{\mu}^{(2)} \\ \boldsymbol{\mu}^{(2)} \end{bmatrix}, \begin{bmatrix} \boldsymbol{\Sigma}_{11} - \boldsymbol{\Sigma}_{12}\boldsymbol{\Sigma}_{22}^{-1}\boldsymbol{\Sigma}_{21} & \mathbf{0} \\ \mathbf{0} & \boldsymbol{\Sigma}_{22} \end{bmatrix} \right)$$

Thus $\mathbf{y}^{(1)}$ and $\mathbf{y}^{(2)}$ are independent, which implies the marginal distribution of $\mathbf{x}^{(2)}$ is $\mathcal{N}(\boldsymbol{\mu}^{(2)}, \boldsymbol{\Sigma}_{22})$.

Because the numbering of the components of \mathbf{x} is arbitrary, we can state the following theorem:

Theorem 3

If $\mathbf{x} \sim \mathcal{N}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$ with $\boldsymbol{\Sigma} \succ \mathbf{0}$, the marginal distribution of any set of components of \mathbf{x} is multivariate normal with means, variances, and covariances obtained by taking the corresponding components of $\boldsymbol{\mu}$ and $\boldsymbol{\Sigma}$, respectively.

Multivariate Normal Distribution (Independence)

Multivariate Normal Distribution (Marginal Distribution)

< □ > < 同 > < 回 > < 回 > < 回 >

In previous section, we focus on non-singular normal normally distributed variate $\mathbf{x} \sim \mathcal{N}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$ with $\boldsymbol{\Sigma} \succ \mathbf{0}$ whose density function is

$$n(\mathbf{x} \mid \boldsymbol{\mu}, \boldsymbol{\Sigma}) = rac{1}{\sqrt{(2\pi)^p \det(\boldsymbol{\Sigma})}} \exp\left(-rac{1}{2}(\mathbf{x} - \boldsymbol{\mu})^\top \boldsymbol{\Sigma}^{-1}(\mathbf{x} - \boldsymbol{\mu})
ight).$$

What about the case of singular Σ ?

イロト イポト イヨト イヨト

General Linear Transformation

We can extend Theorem 1 to Theorem 4

Theorem 1

Let $\mathbf{x} \sim \mathcal{N}_{\rho}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$, with $\boldsymbol{\Sigma} \succ \mathbf{0}$. Then

 $\mathbf{y} = \mathbf{C}\mathbf{x}$

is distributed according to $\mathcal{N}_{p}(\mathbf{C}\boldsymbol{\mu}, \mathbf{C}\boldsymbol{\Sigma}\mathbf{C}^{\top})$ for non-singular $\mathbf{C} \in \mathbb{R}^{p \times p}$.

Theorem 4

Let $\mathbf{x} \sim \mathcal{N}_p(\boldsymbol{\mu}, \boldsymbol{\Sigma})$, with $\boldsymbol{\Sigma} \succ \mathbf{0}$. Then

 $\mathbf{z} = \mathbf{D}\mathbf{x}$

is distributed according to $\mathcal{N}_q(\mathbf{D}\mu,\mathbf{D}\mathbf{\Sigma}\mathbf{D}^{\top})$ for $\mathbf{D} \in \mathbb{R}^{q \times p}$ of rank $q \leq p$.

イロト 不得 トイヨト イヨト

General Linear Transformation

For any transformation z = Dx, for $D \in \mathbb{R}^{q \times p}$ and *p*-dimensional random vector x, we have

$$\mathbb{E}[\mathbf{z}] = \mathbf{D} \boldsymbol{\mu}$$
 and $\operatorname{Cov}[\mathbf{z}] = \mathbf{D} \boldsymbol{\Sigma} \mathbf{D}^{\top}$.

If $q \leq p$ and **D** is of rank q, we can find a $(p - q) \times p$ matrix **E** such that

$$\begin{bmatrix} z \\ w \end{bmatrix} = \begin{bmatrix} D \\ E \end{bmatrix} x$$

is a non-singular transformation.

Then z and w have a joint normal distribution, and z has a marginal normal distribution by Theorem 3.

イロト 不得 トイラト イラト 一日

General Linear Transformation

Theorem 4

Let $\mathbf{x} \sim \mathcal{N}_p(\boldsymbol{\mu}, \boldsymbol{\Sigma})$, with $\boldsymbol{\Sigma} \succ \mathbf{0}$. Then

 $\mathbf{z} = \mathbf{D}\mathbf{x}$

is distributed according to $\mathcal{N}_q(\mathbf{D}\mu,\mathbf{D}\mathbf{\Sigma}\mathbf{D}^{\top})$ for $\mathbf{D} \in \mathbb{R}^{q \times p}$ of rank $q \leq p$.

Can we extend **D** to any real matrix?

く 目 ト く ヨ ト く ヨ ト

In the case of the singular normal distribution, the mass is concentrated on a given linear set. The probability associated with any set not intersecting the given linear set is 0.

For example, consider that

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \sim \mathcal{N} \left(\begin{bmatrix} 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} \right)$$

Such **x** cannot have a density at all, because the probability of any set not intersecting the x_2 -axis is 0 would imply that the density is 0 almost everywhere.

- 4 回 ト 4 ヨ ト 4 ヨ ト

Singular Normal Distributions

Suppose that $\mathbf{y} \sim \mathcal{N}_q(\boldsymbol{\nu}, \mathbf{T})$, $\mathbf{A} \in \mathbb{R}^{p \times q}$ with p > q and $\boldsymbol{\lambda} \in \mathbb{R}^p$; then we say that

$$\mathsf{x} = \mathsf{A}\mathsf{y} + \lambda$$

has a singular (degenerate) normal distribution in *p*-space.

We have
$$\mu = \mathbb{E}[\mathbf{x}] = \mathbf{A}\nu + \lambda$$
 and
 $\mu = \mathbb{E}[\mathbf{x}] = \mathbf{A}\nu + \lambda$ and $\mathbf{\Sigma} = \operatorname{Cov}(\mathbf{x}) = \mathbf{A}\mathbf{T}\mathbf{A}^{\top}.$

The matrix Σ is singular and we cannot write the normal density for x.

In fact, \mathbf{x} cannot have a density at all.

イロト 不得下 イヨト イヨト 二日

Singular Normal Distributions

Now we give a formal definition of a normal distribution that includes the singular distribution.

Definition

A *p*-dimensional random vector **x** with $\mathbb{E}[\mathbf{x}] = \boldsymbol{\mu}$ and $\operatorname{Cov}(\mathbf{x}) = \boldsymbol{\Sigma}$ is said to be normally distributed [or is said to be distributed according to $\mathcal{N}_p(\boldsymbol{\mu}, \boldsymbol{\Sigma})$] if there is a transformation

$$\mathbf{x} = \mathbf{A}\mathbf{y} + \boldsymbol{\lambda},$$

where $\mathbf{A} \in \mathbb{R}^{p \times r}$, r is the rank of $\boldsymbol{\Sigma}$ and $\mathbf{y} \sim \mathcal{N}_r(\boldsymbol{\nu}, \mathbf{T})$ with $\mathbf{T} \succ \mathbf{0}$.

If Σ has rank p, then we can take A = I and $\lambda = 0$.

More General Linear Transformation

Theorem 5

Let $\mathbf{x} \sim \mathcal{N}_{p}(\boldsymbol{\mu}, \boldsymbol{\Sigma})$. Then

 $\mathbf{z} = \mathbf{D}\mathbf{x}$

is distributed according to $\mathcal{N}_q(\mathsf{D}\mu,\mathsf{D}\Sigma\mathsf{D}^{\top})$ for any $\mathsf{D}\in\mathbb{R}^{q\times p}$.

We do not require additional assumptions on **D** or Σ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <
